

PROTOTYPE PM 6.0

TrustFix — Home Services, Trusted BY THE SERVICES

<https://nktrustfixpm6-0week3e-cellitguwahati.netlify.app/>

TrustFix

We built it. Here's what we got wrong.

Last week we drew screens. This week we made them clickable — and discovered 5 things we'd quietly assumed were solved.

WE WERE WRONG ABOUT 5 THINGS

SLIDE 02

A wireframe lets you avoid hard decisions. Building forces them.

The verified filter breaks at launch

Reality: We assumed supply would exist when customers arrived. It won't.

Fix: Added empty-state copy + a toggle. In beta, default to all pros — not verified-only.

Booking requests silently expired

Reality: The 5-minute countdown was in the wireframe but had no feedback state.

Fix: Countdown now visible on pro dashboard. Customer sees a 'finding your pro' state.

Only the pro was confirming job completion

Reality: Pro marks done → payment releases. The customer had no say.

Fix: Both parties must confirm. Review, guarantee, and payment all unlock after customer confirms.

The availability toggle was cosmetic

Reality: It existed in the wireframe but didn't actually gate booking requests.

Fix: Toggle now actively stops incoming requests. Offline = no new bookings. Simple, essential.

We nearly removed cash payment

Reality: UPI and card felt modern. Cash felt like a concession.

Fix: Kept it. Removing cash would kill supply-side adoption in Tier-2. Trust isn't always digital.

WHAT WE CHOSE TO BUILD — AND WHAT WE SKIPPED

SLIDE 03

We picked the flows you can't validate on paper. Everything else is left for real engineers.

✓ Built (8 flows)

- **OTP login** You can't test trust without a real identity step.
- **Home + category grid** It's the entry point for 90% of bookings.
- **Search + verified toggle** This is where the empty-state bug was hiding.
- **Pro profile — 3 tabs** Reviews, pricing, and availability are the 3 trust signals.
- **3-step booking flow** Every drop-off point lives here. Had to be clickable.
- **Confirmed + live tracking** Post-booking anxiety kills re-booking. Had to feel real.
- **Rating & review** The trust flywheel only works if this completes correctly.
- **Pro dashboard (3 screens)** Acceptance flow, jobs list, earnings — all core to pro retention.

⏮ Deliberately skipped

- **In-app chat**
WhatsApp covers this at MVP. High build effort, low learning.
- **Admin dispute panel**
Internal tool. Doesn't need prototyping — just specs.
- **KYC document upload**
Native device camera. Assumed complete in flow.
- **Referral & notifications**
Growth layer. Not what we needed to validate.

Rule: Build what you can't think your way through. Skip what any developer can figure out from a spec.

THE CUSTOMER EXPERIENCE — SCREEN BY SCREEN

SLIDE 04

8 screens · Every trust gate is live · Both sides of the confirmation enforced

01

OTP Login

Phone → 6-digit OTP → profile. No email, no password. Verified phone is the identity.

02

Home Screen

Category grid + top-rated pros. Verified badge shows by default. Hi [name] feels personal.

03

Search + Filter

KYC toggle is live. Turn it off — empty state tells you why and what to do next.

04

Pro Profile

Three tabs: Overview, Reviews, Pricing. Verified badge, job count, transparent rates.

05

Book (3 steps)

Date → address + service → payment with full breakdown. Guarantee badge at checkout.

06

Confirmed + Track

Booking card → map tracking → 5-step progress bar. 'Simulate complete' for testing.

07

Rate & Review

Stars → quick tags → optional text. 7-day guarantee activates only on submit.

THE PROFESSIONAL EXPERIENCE — WHAT WE LEARNED BUILDING IT

SLIDE 05

Three screens. Each one revealed something the wireframe had quietly glossed over.

Dashboard — Home

- Toggle is live — offline means zero incoming requests
- Booking request shows customer name, job, distance, pay, countdown
- One tap to accept. Accepted state shows navigation prompt
- Stats visible at top: earnings, jobs, rating — context before deciding

What we learned: pros don't just want jobs — they want to know if the job is worth their time before tapping accept.

Jobs List

- Tabs: Upcoming / Completed / Cancelled
- Each job shows the customer, time slot, and confirmed price
- Active jobs have a Navigate CTA — no extra steps
- Completed jobs show the rating the customer left

What we learned: showing earnings per job matters more than the total. Pros mentally compare jobs before accepting.

Earnings Dashboard

- Monthly total with % change vs last month
- Available vs. pending clearance split — not just one number
- Per-job average shown alongside total
- Withdraw button only unlocks after clearance period

What we learned: 'pending vs available' is not a nice-to-have. Pros need to know when money arrives, not just how much.

HOW WE ACTUALLY BUILT THIS

SLIDE 06

No Figma. No React boilerplate. Just Claude, a browser, and iteration.

Claude as the builder

Described each screen in plain language. Claude wrote the code. Tested in browser. Found a bug. Described it. Fixed it. That loop — repeated 30+ times — is what vibe coding actually looks like.

~6 hours total · ~700 lines · 0 npm packages

Vanilla JS + CSS custom properties

A single state object drives all 12 screens. Every tap updates state → re-renders the screen. No framework, no build step, no bundler. Runs in any browser.

Single file · Exportable to React in <1hr

Why not Figma or a no-code tool?

Figma prototypes look interactive but break the moment you try real data, conditional logic, or empty states. Vibe coding forced us to handle every state — that's where the 5 gaps surfaced.

Real interactivity → real product decisions

What the tool taught us

You can describe a screen in 2 minutes. Wiring two screens together takes 10. Handling every edge case between them takes another hour. That gap is where most product thinking lives.

The building is the thinking

WHERE OUR THINKING ACTUALLY CHANGED

SLIDE 07

Not every assumption was wrong. But five of them were — and building is what caught them.

What we got wrong	What we assumed	How we fixed it
The verified filter empties the screen	<i>We assumed supply would exist before customers arrived.</i>	Empty-state added. In beta, show all pros. KYC filter is a preference, not a gate.
Reviews were always unlockable	<i>Wireframe showed review tab as always visible on pro profiles.</i>	Reviews now locked until both parties confirm the job is done. Fake reviews become impossible.
Availability toggle was UI decoration	<i>The toggle existed but didn't block incoming requests for offline pros.</i>	Toggle now gates requests. Offline = no bookings. Became our primary pro retention lever.
One party confirming job completion was enough	<i>Pro marks done → payment releases. Customer had no input.</i>	Dual confirmation required. Payment, review, and guarantee all wait for the customer.
Cash was an edge case	<i>We almost cut cash. UPI felt like the future.</i>	Cash is still ~40% of transactions in Tier-2. Cutting it would have killed supply-side adoption.

WHAT CHANGED IN THE MVP

SLIDE 08

Mostly unchanged — which means Week 2 prioritisation held up. Three items moved up.

Still Must Have — no change

- Pro onboarding & KYC (Aadhaar/PAN)
- Search + category discovery
- 3-step booking + confirmation
- Post-service ratings & reviews

Still Should Have

- Real-time GPS tracking
- Cancellation & rescheduling
- Pro earnings dashboard
- Admin dispute resolution panel

Moved up → Now Must Have

- Availability toggle that actually gates requests
- Empty-state handling for zero-supply searches
- Dual job-done confirmation by both parties

Still not in v1

- AR room scanning
- AI dynamic pricing
- Referral program (post-launch growth)

UPDATED METRICS & RISKS — THE PROTOTYPE VERSION

SLIDE 09

What we're measuring now

North Star still: Successful Bookings per Week

Target: 500 SBW by end of Month 3 — not changing this.

New metrics the prototype taught us to track:

- **Empty-state conversion**
Do users who hit zero results toggle the filter and still book?
- **Dual-confirm rate**
Does the customer confirm within 2hrs, or do they ghost?
- **Pro availability uptime**
How many hours a day do active pros stay online? (Target: 6+)
- **Booking-to-track rate**
Do confirmed customers open the tracking screen? (Anxiety signal)
- **Review submission rate**
Do completed jobs get rated? Target is 60%+ — flywheel depends on it.

New risks we didn't see until we built it

The dual-confirm can freeze payments

Risk: If the customer doesn't confirm, the pro waits for money.

Fix: Auto-confirm after 4 hours unless a dispute is raised.

Cash has no paper trail

Risk: Cash jobs bypass the platform — no proof, no accountability.

Fix: Digital receipt is mandatory even for cash. Work photo required.

Pros will game the toggle

Risk: Go offline during slow hours, back on for big jobs.

Fix: Track acceptance rate. Low rate = visibility penalty in search.

Empty state causes early churn

Risk: First-time user sees 'no pros' and leaves before finding the toggle.

Fix: Default to all pros in beta. KYC filter is opt-in, not default.

TrustFix

Week 3 done.

We built it.

We were wrong about some of it.

We fixed it.

Both journeys are clickable

Customer books. Pro accepts. Tracking works. Review submits. End to end.

5 gaps found and closed

Empty state, dual-confirm, toggle gating, cash payments, review timing.

MVP got sharper

Three things moved from 'nice to have' to 'this breaks the product without it'.

5 new things to measure

We couldn't have defined these metrics until we clicked through the flows ourselves.

"A wireframe is a promise. A prototype is proof."
